

CIS2232 – Project Topic Document

Food Delivery Calculator

Developer: Harry Abraham

Business Analyst: Hassan

Project Manager / Quality Assurance: Prabin

PROJECT DESCRIPTION

The Food Delivery Calculator is a web application designed to calculate the total cost of a food delivery order. The application will allow users to enter information about a food order, such as the customer name, restaurant name, food subtotal, delivery distance, and tip amount.

The application will calculate the delivery fee based on the delivery distance and then calculate the final cost of the order. The order information and calculated values will be stored in a database so that orders can be added, viewed, updated, and deleted.

PROJECT COLOR

Dark Red

REQUIRED FIELDS

Order ID

Type: Integer

Description: A unique identifier automatically assigned to each order.

Customer Name

Type: String

Description: The name of the customer placing the order.

Restaurant Name

Type: String

Description: The name of the restaurant.

Food Subtotal

Type: Double

Description: The total price of the food before delivery fee and tip.

Delivery Distance

Type: Double

Description: The delivery distance in kilometers.

Delivery Fee

Type: Double

Description: The delivery charge calculated using the delivery distance.

Tip Amount

Type: Double

Description: The tip added by the customer.

Total Cost

Type: Double

Description: The final calculated cost of the order.

CALCULATION

The application will calculate the delivery fee based on the delivery distance.

Delivery Fee = Delivery Distance $\times$ \$1.50

The final order cost will be calculated using:

Total Cost = Food Subtotal + Delivery Fee + Tip Amount

Example:

If the food subtotal is \$25.00, the delivery distance is 4 km, and the tip amount is \$3.00:

Delivery Fee = $4 \times \$1.50 = \6.00

Total Cost = $\$25.00 + \$6.00 + \$3.00 = \34.00

Therefore, the total cost of the food delivery order is \$34.00.

REPORT REQUIREMENTS

The application will generate an Order Summary Report.

The user will enter an Order ID to generate the report.

The report will display:

- Order ID
- Customer Name
- Restaurant Name
- Food Subtotal
- Delivery Distance
- Delivery Fee
- Tip Amount
- Total Cost

The report will also be written to a file.
